Abstracts

The global Transcranial Magnetic Stimulation (TMS) Service market size is expected to reach \$ 171 million by 2032, rising at a market growth of 5.0% CAGR during the forecast period (2026-2032).

Transcranial magnetic stimulation (TMS) services are non-invasive brain stimulation treatments provided by hospitals, mental health institutions, neuromodulation centers, specialist clinics, or chain medical service platforms. Based on TMS equipment and standardized clinical treatment procedures, these services are offered to patients with mental and neurological disorders. TMS services focus on outpatient treatment services centered around TMS, rTMS, Deep TMS, iTBS, and accelerated TMS protocols. These services typically include patient screening, indication assessment, treatment target localization, motor threshold measurement, magnetic stimulation parameter setting, treatment execution, efficacy evaluation, maintenance therapy, and insurance/payment support.

From a demand structure perspective, treatment-resistant depression remains the largest revenue source for TMS (Therapeutic Treatment) services, while indications such as obsessive-compulsive disorder, anxiety and depression, smoking cessation, neurorehabilitation, and chronic pain represent growth potential. Medicare and commercial insurance coverage in the US are crucial foundations for increasing service penetration. In Europe, public and private insurance systems significantly impact accessibility, while the Chinese and Asian markets are more influenced by hospital department capabilities, physician awareness, patient out-of-pocket payment capacity, and the number of available devices. With iTBS and accelerated TMS shortening the duration of each treatment session, service providers can theoretically improve device

turnover and revenue efficiency per site; however, their commercialization success still depends on indication approval, payment policies, and clinical acceptance. Future service growth will come not only from new treatment sites but also from increased utilization of existing sites and improved combination treatment pathways.
