Abstracts

The global Transcritical Booster System market size is expected to reach \$ 1050 million by 2032, rising at a market growth of 11.3% CAGR during the forecast period (2026-2032).

A Transcritical Booster System is a refrigeration architecture using carbon dioxide (R744) as a natural refrigerant, where the high-pressure side operates above CO₂'s critical point (31.1°C, 7.38 MPa). In 2025, global Transcritical Booster System production reached approximately 24.63 K Units. Upstream components: CO₂ compressors, high-pressure valves, gas coolers, expansion valves, pressure vessels, and control systems. Compressors and HP valves represent the highest technical barriers.

Driven by global decarbonization targets and tightening F-gas regulations, the technology is increasingly becoming a mainstream replacement for HFC-based refrigeration systems, particularly in supermarkets and cold chain logistics applications. Regulatory phase-out of high-GWP refrigerants, demand for higher energy efficiency, and rapid expansion of cold chain infrastructure worldwide. From a technology perspective, the industry is evolving from basic booster architectures toward advanced configurations such as parallel compression, ejector-based efficiency enhancement, and AI-driven system optimization, significantly improving performance under high ambient temperatures. Overall, the Transcritical Booster System is transitioning from a Europe-driven environmental solution into a global low-carbon refrigeration infrastructure standard.

This report studies the global Transcritical Booster System production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Transcritical Booster System and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2025 as the base year.
