Abstracts

According to our (Global Info Research) latest study, the global Transdermal Microarray Patches market size was valued at US\$ 417 million in 2025 and is forecast to a readjusted size of US\$ 653 million by 2032 with a CAGR of 6.6% during review period.

Transdermal Microarray Patches are skin-applied patches that carry a dense array of microscopic projections (microneedles) designed to painlessly breach the outer skin barrier and deposit a drug into the shallow skin layers for absorption. Depending on the design, the microprojections may be dissolving/biodegradable (releasing the dose as the tips dissolve), coated (drug layer transfers off the projections), solid (create microchannels for a separately applied formulation), or hollow (infuse a liquid). Because they can enable simple patch-like self-administration, avoid sharps waste, and potentially improve stability for certain formulations, microarray patches are being developed for vaccines, biologics, and small-molecule therapies where easier delivery and better adherence are valuable. Consumer/cosmetic microneedle patches typically cost between \$0.75 and \$1.60 per patch. Vaccine microarray patches (MAPs) cost between \$0.85 and \$5.00 per dose/patch.

Transdermal Microarray Patches sit at the intersection of pharma formulation and precision microfabrication. Upstream inputs include the active drug substance (small molecules, biologics, or vaccine antigens), stabilizing excipients (sugars, polymers, buffers, surfactants), and microneedle structural materials (dissolving polymers/sugars for soluble MAPs, or silicon/metal/ceramic/rigid polymers for insoluble designs), plus high-precision tooling and equipment (micro-molds, etching/laser machining, coating/casting and drying systems) and medical-grade converting materials (backing films, pressure-sensitive adhesives, liners, desiccants, foil pouches). Manufacturing

then combines microneedle array formation, drug loading (tip-casting, matrix mixing, or surface coating), moisture-controlled drying/curing, lamination/assembly, and rigorous QC for dose uniformity, mechanical strength and insertion performance, extractables/leachables, and stability; depending on product, it may also include sterilization or aseptic controls and an applicator. Downstream, MAPs are supplied as combination products through clinical-trial and commercial channels, with packaging and logistics designed around humidity/temperature sensitivity and traceability; end users range from self-administration at home (chronic therapies) to clinics and mass-immunization programs, with training, labeling, and pharmacovigilance requirements that resemble both drug and device workflows.
