According to our (Global Info Research) latest study, the global Transesophageal Echocardiography (TEE) market size was valued at USD 524.8 million in 2023 and is forecast to a readjusted size of USD 677.3 million by 2030 with a CAGR of 3.7% during review period.

Transesophageal echocardiography (TEE) is a test that produces pictures of the heart. TEE uses high-frequency sound waves (ultrasound) to make detailed pictures of the heart and the arteries that lead to and from it. Unlike a standard echocardiogram, the echo transducer that produces the sound waves for TEE is attached to a thin tube that passes through the mouth, down throat and into esophagus. Because the esophagus is so close to the upper chambers of the heart, very clear images of those heart structures and valves can be obtained.
