## Abstracts

According to our (Global Info Research) latest study, the global Transferrin market size was valued at USD 15 million in 2023 and is forecast to a readjusted size of USD 27 million by 2030 with a CAGR of 8.0% during review period.

Transferrins are glycoproteins that are often found in biological fluids of vertebrates. When a transferrin protein loaded with iron encounters a transferrin receptor on the surface of a cell, e.g., erythroid precursors in the bone marrow, it binds to it and is transported into the cell in a vesicle by receptor-mediated endocytosis. The pH of the vesicle is reduced by hydrogen ion pumps (H<sup>+</sup> ATPases) to about 5.5, causing transferrin to release its iron ions. Iron release rate is dependent on several factors including pH levels, interactions between lobes, temperature, salt, and chelator. The receptor with its ligand bound transferrin is then transported through the endocytic cycle back to the cell surface, ready for another round of iron uptake. Each transferrin molecule has the ability to carry two iron ions in the ferric form (Fe<sup>3+</sup>).

Transferrin is composed of two groups, human transferrin and bovine transferrin, and the bovine transferrin took up 95.19% of the consumption market in 2019.

Americas, with the market share of 51.68%, was the region that consumed the largest part of transferrin market and followed by Europe, which took up 30.35% of the transferrin consumption market and Asia Pacific, 15.99%.
