According to our (Global Info Research) latest study, the global Transformer Insulation Boards market size was valued at US\$ 1206 million in 2025 and is forecast to a readjusted size of US\$ 2008 million by 2032 with a CAGR of 7.6% during review period.

Transformer insulation board is a high-performance insulating material specifically used inside power transformers for electrical insulation and structural support. It is typically made from compressed cellulose fiberboard, epoxy resin, or other insulating materials, offering excellent electrical insulation, mechanical strength, and heat resistance. In transformers, it mainly serves to isolate windings from each other and from the core, preventing electrical short circuits and partial discharges, thus ensuring stable long-term operation. Insulation boards are available in various thicknesses and sizes to meet different application needs and are widely used in oil-immersed and dry-type transformers, making them a critical component for the safety and performance of power equipment. This report studies both insulation pressboard and component market.

The key drivers of the transformer insulation board market include the continuous expansion and upgrading of global power infrastructure, the accelerated modernization of power grids, and the rapid development of renewable energy projects. These factors have spurred the demand for high-performance transformers, thereby boosting the procurement of insulation materials, particularly insulation boards. Moreover, transformers operate in harsh environments characterized by high voltages and temperatures, which places higher requirements on the heat resistance, mechanical strength, and electrical stability of the insulation boards. This, in turn, drives manufacturers to continuously improve material performance, further fostering

technological upgrades and market growth.
