Abstracts

Transient protein expression, that is, in the initial stage after transient transfection, the plasmid or DNA fragment is free in the cell and can be expressed, which is called transient transfection expression. Subsequently, the plasmid or DNA fragment free in the cell has two kinds of naturalization, one is degraded, and the other is inserted into the chromosome and can be continuously and stably expressed.

In terms of vector selection, transient protein expression does not require screening tags, such as the commonly used NEO anti-G418, etc., but stable expression vectors can also be used for transient expression.

According to our (Global Info Research) latest study, the global Transient Protein Expression market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.
