According to our (Global Info Research) latest study, the global Transistor Output Optical Isolator market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

Transistor optical isolators often use light to transmit information across an electrical insulation layer for safety or functional reasons. The difference with other types of optical isolators is that they use simple phototransistors as output devices. The output of these devices does not require an external power source to operate and has analog characteristics, so they can be used to transmit analog information between circuits that cannot be electrically connected.
