Abstracts

According to our (Global Info Research) latest study, the global Transition Metals market size was valued at US$ 1108980 million in 2025 and is forecast to a readjusted size of US$ 1463840 million by 2032 with a CAGR of 4.1% during review period.

The term 'transition metals' refers to any element that belongs to the d-block of the periodic table, which includes groups 3 through 12. A transition metal is an element having a partially filled d-subshell and can produce cations with an incomplete d-sub shell on its atom. Iron, titanium, copper, nickel, manganese, cobalt, silver, mercury, and gold are some of the transitional metals having wide applications in various end-use industries such as automotive, electronic, building & construction, and paints and coatings, andothers.

Iron is the most abundant metal found in Earth's solid crust, ranking fourth among all elements and second among metals in crystal abundance (after aluminum). Transition metals are generally harder, less reactive, and denser as compared to alkali metals. For the metal industry, the US government has recommended some regulations for the welfare of human health and to control air quality, including CAA (Clean Air Act), National Environmental Policy Act (NEPA), The National Ambient Air Quality Standard (NAAQS), State Implementation Plans (SIP), New Source Performance Standards (NSPS), and National Emissions Standard for Hazardous Air Pollutants (NESHAPs).
