## Abstracts

According to our (Global Info Research) latest study, the global Translaminar Control Agents market size was valued at US\$ 1929 million in 2024 and is forecast to a readjusted size of USD 2891 million by 2031 with a CAGR of 5.6% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Translaminar control agents are a type of active ingredient that has the ability to penetrate the surface of leaves and are commonly used in pesticides, especially in the field of fungicides and insecticides. Their characteristics are that after the agent is sprayed on one side of the leaf, it can penetrate the mesophyll cell layer and reach the other side of the leaf, thereby providing a double-sided protection effect for the entire leaf surface, even if the pathogens or pests are located on the back of the leaf that is not directly in contact with the agent. This type of control agent is both local and systemic, and is often used to control target pests and diseases such as fungal leaf spot, powdery mildew, and aphids. Compared with traditional contact agents, translaminar control agents have a longer-lasting control time and a higher utilization rate of drug efficacy, and are increasingly valued in modern precision agriculture and efficient crop protection programs.
