Abstracts

According to our (Global Info Research) latest study, the global Translocated Herbicides market size was valued at US\$ 12540 million in 2024 and is forecast to a readjusted size of USD 18880 million by 2031 with a CAGR of 6.0% during review period.

Some herbicides can be absorbed by the rhizomes and leaves of weeds separately or simultaneously, and transported to various parts of the plant body through the conducting tissues, destroying its internal structure and physiological balance, thereby causing plant death. This behavior is called systemic. Herbicides with this characteristic are called systemic herbicides. For example, 2-Methyl-4-chloro-4-chloride and glyphosate can be absorbed by the stems and leaves of plants, and then moved to various parts of the plant body, including underground rhizomes. Therefore, glyphosate can not only prevent annual weeds, but also effectively prevent perennial weeds.
