Abstracts

According to our (Global Info Research) latest study, the global Transmission Immersion Probe market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

The Transmission Immersion Probe (TIP) is a device used in the field of transmission electron microscopy (TEM) to study the properties of materials at the atomic scale. It is a specialized sample holder that allows for the direct imaging and analysis of samples in a liquid environment.

Traditionally, TEM samples are prepared by thinning the material and placing it on a grid for imaging in a vacuum. However, many biological and soft materials cannot be imaged in their native state due to the requirement of a vacuum. The TIP overcomes this limitation by allowing the sample to be immersed in a liquid, enabling the study of materials in their natural environment.

The TIP consists of a specialized holder that can hold a liquid sample, such as a solution or suspension, and a thin electron-transparent window that allows the electron beam to pass through. The liquid sample is sandwiched between two windows, which are typically made of silicon nitride or graphene, to provide structural support and prevent the liquid from leaking.

By using the TIP, researchers can study dynamic processes, such as the behavior of nanoparticles, protein folding, and chemical reactions, in real-time and at high resolution. It has applications in various fields, including biology, chemistry, materials science, and nanotechnology.
