Abstracts

The global Transmissive VPH Grating market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Transmissive VPH gratings are usually made of photosensitive materials. The interference pattern of the light field is recorded into the photosensitive material using laser interference or computer-generated methods to form the structure of a volume phase grating. Transmissive VPH gratings can provide high-resolution spectral information and occupy a small space in optical systems, so they are widely used in fields that require high-performance optical components.

The transmissive VPH grating is a specially designed optical element used to disperse and manipulate the wavelength of light, with higher spectral resolution, higher light utilization efficiency and wider operating wavelength range.

This report studies the global Transmissive VPH Grating production, demand, key manufacturers, and key regions.
