Abstracts

The global Transmissometer market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The Transmissometer is an instrument for measuring the extinction coefficient of the atmosphere and sea water and determining the visual range. It works by sending a narrow collimated beam of energy (usually a laser) through a propagating medium. A narrow field of view receiver at a specified measurement distance determines how much energy reaches the detector and determines the path transmission and/or extinction coefficient. In a transmissometer, the extinction coefficient is determined by measuring the direct light transmission, which is then used to calculate the visibility range.

This report studies the global Transmissometer production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Transmissometer, and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2022 as the base year.
