A transparent film heater is a type of heating element that consists of a thin, transparent film made of conductive material deposited on a substrate such as glass or plastic. When an electric current is passed through the conductive film, it generates heat which is transferred to the surrounding environment. The transparency of the film allows for easy integration into various applications where visibility is important, such as automotive windows, displays, and smart mirrors. Transparent film heaters have several advantages over traditional heating technologies such as faster response time, lower power consumption, and greater design flexibility.
