The global Transparent Wound Dressing market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Transparent wound dressing is a medical dressing that typically consists of a transparent polyurethane film and glue. It can be used to fix and protect various types of wounds, while allowing oxygen and water vapor to pass through, which helps with wound healing. Compared to traditional gauze dressings, transparent wound dressings can better observe the condition of the wound because they are transparent and allow doctors and patients to see the condition of the wound more clearly. In addition, transparent wound dressings can also prevent water and bacteria from entering the wound, helping to prevent infection.
