The global Transport Adhesive market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Transport adhesive is a general term for any type of adhesive or sealant that is used for bonding or sealing various components or materials in the transport industry. Transport adhesives can have different formulations and properties depending on the application and the substrates involved. Some of the common types of transport adhesives are:

Methyl methacrylate (MMA): These are two-component adhesives that cure rapidly and provide high strength and toughness. They are suitable for bonding metals, plastics, composites, and other materials in structural and multi-material applications.

Modified silane polymer (SMP): These are one-component adhesives that cure by moisture and offer good flexibility and weather resistance. They are ideal for sealing joints, gaps, and cracks in exterior panels, windows, doors, and roofs.

MS polymer: This is a type of SMP that has enhanced adhesion and elasticity. It is used for sealing and bonding applications in various transport vehicles, such as buses, trains, planes, boats, and recreational vehicles.

Polyurethane (PU): These are one- or two-component adhesives that cure by moisture or heat and provide good adhesion and durability. They are used for bonding wood panels, foam, fabrics, and other materials in interior applications.

Modified epoxy: These are two-component adhesives that cure by heat or ambient temperature and offer high strength and chemical resistance. They are used for bonding

powertrain components, electronics, lighting, and other parts that require high performance.
