## Abstracts

The global Trash Rake market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Trash rake is a mechanical equipment used in water and wastewater treatment systems to remove large solid objects, debris, and vegetation from the incoming water flow. It is commonly used in intake structures, such as screens or bar racks, to prevent clogging and protect downstream equipment and processes.

The trash rake typically consists of a rake arm or multiple rake arms attached to a rotating mechanism. As the rake arms rotate, they move along the surface of the screen or rack, collecting and lifting debris out of the water. The collected trash is then discharged into a container or conveyor for removal and proper disposal.

Trash rakes are often automated and can be programmed to operate at specific intervals or based on water flow rates. They are essential in maintaining the efficiency and functionality of water intake systems, preventing damage to pumps, turbines, and other downstream equipment. They are commonly used in water treatment plants, wastewater treatment plants, hydroelectric power plants, and other industrial facilities that require continuous water flow.

This report studies the global Trash Rake production, demand, key manufacturers, and key regions.
