Abstracts

The global Trash Skimmer Boat market size is expected to reach \$ 2215 million by 2032, rising at a market growth of 4.3% CAGR during the forecast period (2026-2032).

Trash Skimmer Boat are a type of engineering vessel specifically used for water environment management. They mainly collect floating garbage (such as plastics, oil contaminated debris, aquatic plants, and solid waste) in rivers, lakes, ports, bays, and other water bodies through mechanical or semi-automatic devices, and transport them to onshore treatment or transfer stations.

From a functional perspective, these types of ships are usually equipped with conveyor belts, adsorption devices, salvage arms or screen systems, and some also integrate compression, sorting or water quality monitoring functions to improve cleaning efficiency and reduce secondary pollution. Its core goal is to improve the quality of water environment, reduce the spread of pollutants, and support the daily maintenance of urban water bodies and ports. In 2025, global Trash Skimmer Boat production reached approximately 18,796 Units, with an average global market price of around K US\$ 85 per unit.

The growth of trash skimmer boat mainly comes from the tightening of global environmental regulations, the intensification of marine plastic pollution, and the increasing demand for urban water governance. Port management agencies, municipal departments, and environmental organizations are the main purchasers, with commercial applications dominating.

In addition to traditional ports and urban river management, tourist attractions, private docks, industrial water bodies, and large-scale ecological restoration projects are also

increasing their use, promoting the market to evolve from 'government procurement led' to 'multi-party participation'.
