Abstracts

The global Travelling Band Screen market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Travelling Band Scree is a type of mechanical equipment used in wastewater treatment plants and industrial processes to remove small organic and inorganic particles from liquid flows.

The travelling band screen consists of a continuous belt or mesh that moves along a series of rollers. The belt or mesh is typically made of stainless steel wires or synthetic materials with precise sieve openings. As the liquid flows through the screen, the particles are trapped on the surface of the moving belt or mesh, while the clean liquid passes through.

The captured particles are then removed by brushes, sprayers, or other means as the belt or mesh travels through the system. The travelling band screen can be adjusted according to the desired filtration size and can effectively remove fine solids, debris, fibers, or other suspended materials from the liquid.

Travelling band screens are commonly used in wastewater treatment plants, industrial process water treatment, pulp and paper mills, and other applications requiring fine particle removal. They help protect downstream equipment, such as pumps and membranes, from clogging or damage caused by small solid particles.

This report studies the global Travelling Band Screen production, demand, key manufacturers, and key regions.
