## Abstracts

According to our (Global Info Research) latest study, the global Travelling Wave Fault Location System for Distribution Network market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Distribution lines stretch out into the wild, and the operating environment is complex. They often fail due to external forces such as lightning, wildfires, and trees, and cause power outages for users, affecting production and life, and bringing direct power sales losses to the grid. Therefore, it is particularly important for the operation of the power grid to provide early warning of defects before a fault occurs, and quickly find and eliminate it after a fault occurs.

The distribution network traveling wave fault early warning and location system is based on mature traveling wave ranging technology, which integrates many advanced technologies such as smart sensors, mixed supply and energy extraction, and deep learning algorithms, and wide-area synchronous collection of high-frequency traveling wave currents of distribution lines, Power frequency current, can monitor the potential grounding hazards of the line without omission, give early warning, and realize precise positioning of faults at the tower level. To achieve the purpose of strengthening the investigation of hidden dangers of line defects, improving the accurate positioning and rapid processing of single-line grounding faults in distribution networks, and providing technical support for lean operation and maintenance of distribution networks.
