According to our (Global Info Research) latest study, the global Trench Field Stop IGBT market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Trench type field stop IGBT is a power semiconductor device commonly used in high voltage and high current applications. Compared with conventional IGBTs, trench-type field-stop IGBTs have higher switching speed and lower turn-on voltage drop, which can achieve higher efficiency and higher frequency operation. The trench type field stop IGBT is characterized by the 'trench' in its structure. These trenches reduce the leakage current of the IGBT, thereby reducing the turn-on voltage drop of the device. At the same time, the trenches can also increase the switching speed of the device, because they reduce the distance that electrons can drift in the transistor, thereby reducing the drift time. In addition, the trench-type field-stop IGBT also uses the 'field-stop' technology, that is, by adding a P-type region to the device to increase the cut-off voltage of the device. This technology can make the IGBT have higher withstand voltage capability and lower switching loss in the switching state. In general, the trench-type field stop IGBT is a high-efficiency, high-performance power semiconductor device suitable for applications requiring high voltage and high current, such as power electronics, power converters, motor drives, etc.
