Abstracts

The global Triallylamine market size is expected to reach \$ 65.91 million by 2032, rising at a market growth of 4.5% CAGR during the forecast period (2026-2032).

In 2024, global triallylamine production was approximately 6,500 tons, with an average selling price of about US\$6,950 per ton. Production capacity in 2024 was 8,300 tons, with an average gross profit margin of approximately 20-30%. Triallylamine is an organic nitrogen-containing tertiary amine, a colorless liquid with an ammonia odor at room temperature. It is strongly alkaline, reacts with acids, is slightly soluble in water but readily soluble in organic solvents, and is an important intermediate in uranium and rare metal extraction, resin modification, organic synthesis, and ion exchange resin manufacturing.

The core upstream raw materials for triallylamine are propylene and liquid ammonia, which are produced through a high-pressure amination reaction under the action of a catalyst. Its downstream applications are highly concentrated in the functional materials field, mainly including: as an organic synthesis intermediate, used in the production of quaternary ammonium salts, specialty surfactants, and pharmaceutical/pesticide molecules; as a resin modifier, used to improve its heat resistance, adhesion, and mechanical properties; and as a polymer crosslinking agent, its core application is in constructing three-dimensional network structures in ion exchange resins, UV-curable coatings, and sealants, endowing materials with stable chemical properties and strength.
