Abstracts

Triazine UV absorber has a high absorption capacity for 280~380nm UV light. It is a kind of high-efficiency absorbing light stabilizer, which is a derivative of 2-hydroxyphenyltriazine, which contains a hydroxyl group in the ortho position. The ultraviolet absorption effect of this kind of compound is related to the number of adjacent hydroxyl groups, the more the number of adjacent hydroxyl groups, the stronger the ability to absorb ultraviolet rays. Introduce different substituents. It can reduce the basicity of the s-triazine ring, but it improves the light fastness of the compound and the compatibility with the resin. Its disadvantages are poor compatibility with polymers and coloring of the application.
