Abstracts

The global Triethylene Glycol Bis(2-Ethylhexanoate) market size is expected to reach \$ 142 million by 2032, rising at a market growth of 2.9% CAGR during the forecast period (2026-2032).

Triethylene Glycol Bis(2-Ethylhexanoate) is a high-boiling-point ester compound derived from the esterification of triethylene glycol with isooctanoic acid (2-ethylhexanoic acid). It is a colorless or pale yellow, transparent liquid with excellent thermal stability, lubricity, plasticity, and low volatility.

The upstream raw materials for Triethylene Glycol Bis(2-Ethylhexanoate) primarily include triethylene glycol (TEG) and isooctanoic acid (2-ethylhexanoic acid). Raw material prices are influenced by fluctuations in petrochemical raw materials and downstream demand. Major global manufacturers include Dow, SABIC, Shell, Perstorp, and Eastman. Triethylene glycol diisooctanoate is primarily used downstream as a plasticizer, with PVB and related plastic products being its largest consumer.

In 2025, global sales volume is projected to reach approximately 60,000 tons, with an average ex-factory price ranging from \$1,600 to \$2,200 per ton; the gross margins of major industry manufacturers are expected to fall between 15% and 25%.

Industry demand for triethylene glycol diisooctanoate is primarily driven by applications such as PVB interlayer films, PVC plastisols, synthetic rubber, coatings, and sealants; among these, PVB safety glass constitutes the most critical pillar of support. The product's key advantages lie in its low color value, low viscosity, low volatility, and excellent compatibility with PVB resins, enabling it to meet the stringent requirements for transparency, weather resistance, and processing stability demanded by automotive

windshields and architectural laminated glass. In the future, growth in demand for this product will be largely fueled by upgrades in the requirements for automotive laminated glass, architectural safety glass, and high-transparency PVB films. Consequently, competitive efforts will increasingly focus on achieving low color values, low odor, low volatility, batch-to-batch consistency, and superior adaptability to specific PVB formulations.
