Abstracts

The global Triglycidylamine market size is expected to reach \$ 872 million by 2032, rising at a market growth of 7.0% CAGR during the forecast period (2026-2032).

Triglycidylamine (TGA) is a multifunctional epoxy compound derived from amine precursors, typically produced by reacting amine compounds (such as ammonia or aliphatic/aromatic amines) with epichlorohydrin, followed by dehydrochlorination to form three reactive glycidyl (epoxy) groups attached to a nitrogen center. It is widely used as a curing agent, crosslinker, and reactive diluent in high-performance epoxy resin systems due to its excellent thermal stability, chemical resistance, and strong adhesion properties. The supply chain of Triglycidylamine starts upstream with petrochemical feedstocks (propylene, epichlorohydrin, and ammonia or specialty amines), followed by intermediate production of epichlorohydrin and amine derivatives by large chemical companies. Midstream involves specialty epoxy chemical manufacturers synthesizing TGA through controlled epoxidation processes, purification, and formulation into liquid or solid epoxy intermediates. Downstream, TGA is supplied to industries such as aerospace composites, electronics encapsulation, coatings, adhesives, and advanced composites, where it is incorporated into high-performance thermosetting resin systems, often alongside other epoxy resins like TGDDM or DGEBA. In 2025, global Triglycidylamine output was about 110,000 tons with 140,000 tons of capacity, average prices of USD 4,000-7,000 per ton, and gross margins around 27%.
