Abstracts

The global Tritium Noble Gas Monitor market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The tritium monitor consists of a tritium measurement ionization chamber and a radon compensation ionization chamber. The tritium measurement ionization chamber is composed of three parallel frames drawn with metal wires in a box with a gas inlet and outlet. The two sides are covered with aluminum polyester film. The window and the collecting plate constitute the radon compensation ionization chamber. Since the tritium ? cannot penetrate the aluminum polyester film window, the response signals output by the tritium and the radon can be separated. The monitor has a simple structure and is easy to use, and can be used for monitoring tritium in radioactive gases such as radon.
