According to our (Global Info Research) latest study, the global True Color Night Vision Systems market size was valued at US\$ 148 million in 2024 and is forecast to a readjusted size of USD 422 million by 2031 with a CAGR of 16.3% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Seeing in color is just what the human body is used to and so a typical individual can mentally process what they're seeing faster with these True Color Night Vision Systems. This more "natural" vision may help further reduce the change of a loss of situational awareness, vertigo, and other issues that traditional night vision goggles can sometimes cause, especially in airborne applications. True color night vision system still have a requirement for a certain amount of ambient light in order to function in color as infrared illuminators do not help bright an area dramatically even at close range. So these systems can't work in total darkness without an additional source of visible light. One way to help mitigate this, at least in part, is by blending the image from a color night vision camera with the one from an infrared camera, thermal imager, or another type of optical sensor, each of which may be able to detect different details. These types of fused images have the potential to be even more detailed and high fidelity, allowing the user to determine highly specific features or even writing on objects in certain cases. Creating a self-contained multi-spectral optic with color night vision and multi-wavelength infrared capability might be another option.

Adding color night vision to the mix would allow pilots, vehicle drivers, mariners, and

individual troops to get color night vision imagery projected straight onto helmet-mounted or wide area displays. Commercial entities and private citizens might use equipment to aid in flying or driving at night, as well. This would also provide major benefits in the future if paired with distributed vision systems on aircraft or ground vehicles, such as the Distributed Aperture System (DAS) on the F-35 Joint Strike Fighter, Israeli firm Elbit's Iron Vision for tanks or Northrop Grumman's Silent Watch for ships. The U.S. Army is already working on a way to blend together imagery from thermal weapon sights with the picture an individual soldier sees through their night vision goggles.
