According to our (Global Info Research) latest study, the global Trunnion and Floating Ball Valves market size was valued at US\$ 10200 million in 2024 and is forecast to a readjusted size of USD 14250 million by 2031 with a CAGR of 5.0% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Floating and trunnion are the two most common types of ball valves. Floating ball valves are often used in industrial applications, while trunnion-mounted valves have a fixed ball and can be adjusted to regulate pressure. Both types can be used to control pressure in industrial and long-distance pipelines. The most important difference between these two design is the construction of the ball and the way in which it is assembled inside the valve body. A trunnion ball is attached and centred inside the valve body through both a top shaft -the valve stem- and a bottom shaft – the trunnion. A floating ball is attached to the valve body only through the valve stem. As a result, the floating ball “floats” in the valve seats.

Trunnion and floating ball valves play a critical role in this optimization by providing reliable shut-off and control functionalities in various stages of the extraction and transportation processes. Moreover, the expansion of oil and gas exploration into more challenging environments, such as deepwater and ultra-deepwater reserves, further underscores the importance of robust valve solutions. In these harsh operating conditions, where pressures and temperatures are extreme, the reliability and durability

of valves become paramount. Trunnion and floating ball valves, known for their ability to withstand high pressures Pumps and temperatures, are preferred choices for such applications, contributing to their increased demand in the market.
