Abstracts

The global Tube Type Graphite Falling Film Absorber market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The tubular graphite falling film absorber is a device used for gas purification treatment. It is mainly used to remove harmful substances in gas, such as sulfur dioxide, nitrogen oxides, chlorine, etc. It is a device based on the principle of chemical absorption. It converts harmful substances into harmless substances by contacting and reacting gas with absorption liquid, thereby purifying gas. This equipment uses graphite as the material of the absorption tower. The absorption liquid is sprayed onto the surface of the graphite, forming a thin film on the surface of the graphite. During the downward flow of the gas, the harmful substances are absorbed and transformed through the contact reaction between the film and the absorption liquid. Is a harmless substance. At the same time, multiple tubes are installed inside the equipment to enhance the gas-liquid mass transfer effect and improve the processing efficiency of the equipment.
