The tubular (shell and tube) heat exchanger is a partition-type heat exchanger in which the wall of the tube bundle enclosed in the shell is used as the heat transfer surface. This kind of heat exchanger has a simple structure, reliable operation, can be made of various structural materials, and can be used under high temperature and high pressure. It consists of a shell, a heat transfer tube bundle, a tube sheet, a baffle (baffle), a tube box and other components. The shell is mostly cylindrical, with a tube bundle installed inside, and both ends of the tube bundle are fixed on the tube plate.

Tubular (shell and tube) heat exchangers have the characteristics of wide application range, high efficiency, simple maintenance, and strong scalability. They are used in processes such as heating, cooling, evaporation, and condensation.
