Abstracts

The global Tungsten Carbide Roller market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Hard alloy roller (also known as tungsten carbide roller) refers to a roller made of materials such as tungsten carbide and cobalt using powder metallurgy methods. There are two types of hard alloy rollers: integral and combined. Excellent performance, stable quality, high product processing accuracy, good wear resistance and high impact resistance. Hard alloy rollers are made of materials such as tungsten carbide and cobalt using powder metallurgy methods. There are two types of hard alloy rollers: integral and combined. Hard alloy rollers can be divided into two types according to their structural form: integral hard alloy rollers and composite hard alloy rollers. The integral hard alloy roller has been widely used in the pre finishing and finishing stands of high-speed wire rolling mills, including the sizing and reducing stands, pinch roll stands, and so on. Composite hard alloy roller is composed of hard alloy and other materials, and can be divided into hard alloy composite roller ring and integral hard alloy composite roller. The hard alloy composite roller ring is installed on the roller shaft; The integral hard alloy composite roller directly casts the hard alloy roller ring into the roller shaft to form a whole, which is applied to rolling mills with high rolling loads.
