Abstracts

The tuning self-locking screw is a special screw that changes the relative position between the screw and the upper surface of the resonator or the side wall of the inner hole by adjusting the depth of the screw into the cavity, thereby changing the capacitance and changing the resonant frequency. This type of screw is often used on cavity filters to adjust the resonant frequency of a single resonant cavity. In addition, self-locking screws generally refer to self-tapping screws that do not need to be used with nuts. Their threads are self-tapping and have a pointed tail. This kind of screw can be screwed directly into a drilled, punched or die-cast hole, and an internal thread is formed in the hole through extrusion to form a reliable locking threaded connection.
