According to our (Global Info Research) latest study, the global Turbine Surface Aerator market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Turbine surface aerator is a type of mechanical device used in wastewater treatment systems and aerobic treatment processes. It is designed to introduce air into water or wastewater by creating turbulence and agitation on the water surface.

The turbine surface aerator typically consists of a motor-driven horizontal or vertical shaft with multiple blades or paddle wheels. When the aerator is activated, the blades rotate, causing the water to be mixed and agitated. This action creates a large surface area contact between the water and air, facilitating the transfer of oxygen from the air into the water.

Turbine surface aerators are commonly used to enhance oxygen transfer and promote biological treatment processes in wastewater treatment plants, lagoons, oxidation ditches, and other aeration basins. They help improve water quality by increasing dissolved oxygen levels and promoting the degradation of organic matter.
