Abstracts

According to our (Global Info Research) latest study, the global Turbocharger for Commercial Vehicles market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

A turbocharger is a turbine-driven forced induction device that increases an internal combustion engine's efficiency and power output by forcing extra compressed air into the combustion chamber. This improvement over a naturally aspirated engine's power output is due to the fact that the compressor can force more air—and proportionately more fuel—into the combustion chamber than atmospheric pressure (and for that matter, ram air intakes) alone.

The growing use of titanium compressor wheels will drive the growth prospects for the global turbocharger market for commercial vehicles in the forthcoming years.

Compressor wheels are usually made from aluminum alloys because these alloys exhibit an excellent ratio between strength, density, and casting ability. However, at present almost all the major tier-1 suppliers are using titanium aluminide compressor wheels in their turbochargers. Some of the major factors responsible for the growing preference of titanium compressor wheels include the endurance to high temperature, low weight, low inertial drag, high responsiveness, and ability to function under high pressure.
