Abstracts

Turbocharger is a type of forced induction system. Turbocharger uses the exhaust flow from the engine to spin a turbine, which in turn spins an air pump, compressing the air following into the engine. Turbocharger lets the engine squeeze more air into a cylinder and more air means more fuel can be added. So the engine can produce more power without increasing the engine emissions. The turbocharger has four main components, the turbine, the compressor, the control system and the bearing system.

SCOPE OF THE REPORT:

Emission Regulation is the major factor, which is driving the turbocharger market. Though most of the countries are concerned about the environmental effects of the automotive emissions, regions like Europe and North America are focusing on emission regulations.

The Euro standards are considered to be the toughest and are followed in countries such as China, and India. These stringent Euro standards are the reasons for vehicles, in the European region, to be turbocharged. Almost every 2 out of 3 vehicles in Europe are turbocharged and is expected to be 3 out of every 4, by 2022. China, owing to its overriding environmental concerns, is poised to be the fastest growing market for turbochargers, followed by India.

The worldwide market for Turbocharger is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2024, from xx million US\$ in 2019, according to a new GIR (Global Info Research) study.
