## Abstracts

According to our (Global Info Research) latest study, the global Turbomachinery Controls market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

A mechanical engineering term, “turbomachinery” describes machines that transfer energy between a rotor and a liquid or gas. Turbines and compressors both fall into this category. Turbines use a fast flow of water, air, or gas to generate shaft power; while compressors pressurize substances by transferring energy from the rotor to a fluid or gas. Turbines and compressors often work in conjunction with each other.

Due to the size, expense, and potential hazards of turbomachinery, companies use control systems to monitor and maintain proper function. Staying up-to-date with innovations in turbomachinery controls can help organizations implement effective solutions.

As technology advances and processes evolve, the need for an updated, effective turbomachinery control solution (TCS) is evident. When turbines, compressors, and centrifugal pumps work together efficiently, the potential for danger or equipment damage is minimized. However, when systems are not regularly analyzed, tested, and monitored, even small disruptions can have significant consequences.
