Abstracts

The global Turbomachinery Controls market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A mechanical engineering term, “turbomachinery” describes machines that transfer energy between a rotor and a liquid or gas. Turbines and compressors both fall into this category. Turbines use a fast flow of water, air, or gas to generate shaft power; while compressors pressurize substances by transferring energy from the rotor to a fluid or gas. Turbines and compressors often work in conjunction with each other.

Due to the size, expense, and potential hazards of turbomachinery, companies use control systems to monitor and maintain proper function. Staying up-to-date with innovations in turbomachinery controls can help organizations implement effective solutions.

As technology advances and processes evolve, the need for an updated, effective turbomachinery control solution (TCS) is evident. When turbines, compressors, and centrifugal pumps work together efficiently, the potential for danger or equipment damage is minimized. However, when systems are not regularly analyzed, tested, and monitored, even small disruptions can have significant consequences.

This report studies the global Turbomachinery Controls demand, key companies, and key regions.
