The global Turnout Monitoring System market size is expected to reach \$ 1208 million by 2032, rising at a market growth of 9.0% CAGR during the forecast period (2026-2032).

Turnout Monitoring System is a railway condition monitoring solution that continuously or periodically observes the health and operating behavior of switches and crossings so maintainers can detect degradation early and prevent failures that disrupt service or create safety risk. It typically collects data from sensors installed on or near the turnout and its switch machine, such as movement and position, force or current signatures, vibration, temperature, and sometimes rail or component condition indicators, then analyzes trends and anomalies to trigger alerts, support diagnostics, and prioritize maintenance actions within an asset management workflow.
