According to our (Global Info Research) latest study, the global Twin-screw Cone Mixer market size was valued at US\$ 192 million in 2024 and is forecast to a readjusted size of USD 260 million by 2031 with a CAGR of 4.5% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The twin-screw conical mixer is a new, efficient and high-precision mixing equipment. The working principle of the twin-screw conical mixer mainly relies on the two asymmetric spirals inside it. The two spirals rotate in the mixer barrel, lift the material upward, and through the slow revolution of the rotating arm, the material outside the spiral enters the stud to varying degrees, thereby achieving the purpose of mixing. Specifically, its movement forms include: the spiral revolves along the wall, so that the material moves in a circle along the cone wall. The spiral self-rotation causes the material to rise along the spiral from the bottom of the cone. The composite movement of the spiral's revolution and self-rotation causes part of the material to be absorbed into the spiral cylindrical surface, and at the same time, under the centrifugal force of the spiral's self-rotation, part of the material in the spiral cylindrical surface is discharged radially toward the cone. The rising material falls under the action of its own gravity. These four movements produce convection, shearing, and diffusion in the mixer, thereby achieving the purpose of rapid and uniform mixing.
