According to our (Global Info Research) latest study, the global Two-component Addition Type Room Temperature Vulcanized Silicone Rubber market size was valued at US\$ 262 million in 2024 and is forecast to a readjusted size of USD 324 million by 2031 with a CAGR of 3.1% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Two-component addition-type room temperature vulcanized silicone rubber is composed of two main components: one is a silicone polymer containing vinyl (or propylene) functional groups, usually as component A; the other is a hydrogen-containing polysiloxane crosslinker, as component B. After mixing, these two components will undergo an addition reaction (hydrogen siloxane reaction) to achieve vulcanization. This reaction can be carried out at room temperature without heating or pressurization. At the same time, no low molecular weight substances are released during the reaction, so no shrinkage occurs during the vulcanization process.

Two-component addition-type room temperature vulcanized silicone rubber is widely used in the electronics industry, mold manufacturing, cultural relics protection, and art and craft reproduction. In the electronics industry, it is used as a moisture-proof, shock-proof, and insulating coating material for electronic components, as well as an ideal potting material in LED production; in mold manufacturing, it is used as an excellent

material for molding, and is used to cast various resins, alloys and other materials; in cultural relics protection and art and craft reproduction, it uses its high simulation and easy demolding properties to achieve the reproduction of cultural relics and the production of art and crafts.
