According to our (Global Info Research) latest study, the global Two-component Automatic Glue Filling Machine market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The two-component automatic glue pouring machine is a device specially used for pouring two-liquid glue. It is a special equipment for two-liquid glue (usually composed of a main agent and a curing agent, sometimes also called agent A and agent B). It can automatically realize the mixing, proportioning and dispensing of glue, thereby saving manpower input and improving production efficiency.

The working principle of the two-component automatic glue pouring machine is based on two gears of the same size meshing and rotating with each other in a tightly fitting housing. The glue is stored in two glue storage barrels respectively, avoiding the problem of curing after mixing. During the glue pouring process, the two groups of glue are mixed in the mixing tank at the front end of the glue outlet, and uniform mixing and dispensing are achieved through a specific equipment structure (such as a mixing tube).

The two-component automatic glue pouring machine is mainly used for products that require two-liquid glue potting, such as electronic products, automotive parts, aerospace equipment, etc. Through precise proportioning and pouring, these products can achieve

waterproof, moisture-proof, anti-leakage, insulation and other protective effects.
