According to our (Global Info Research) latest study, the global Two-Component Dispensing Valve market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

A two-component dispensing valve is a dispensing valve used to mix and dispense two different components, usually two different liquids or glues. This type of glue spray valve usually consists of two independent glue spray channels, which are used to spray two kinds of glue with different components. By controlling the flow rate and ratio of the two channels, the mixed glue can be mixed and sprayed out. Two-component dispensing valves are usually used in situations where two different chemical components need to be mixed during the dispensing process, such as epoxy resin, polyurethane, silicone rubber and other glues that need to be mixed and cured. This kind of glue spray valve can realize mixing during the dispensing process, and adjust the characteristics of the mixed glue, such as hardening speed, hardness, etc., by controlling the flow rate and ratio, so as to meet different dispensing requirements. Two-component dispensing valves usually require a sophisticated control system, including controllers, air sources, and pressure sensors, to ensure that two different components of glue are mixed and sprayed according to a predetermined ratio and flow rate, thereby achieving high-precision dispensing glue effect. This type of glue dispensing valve is widely used in the fields of automobile manufacturing, electronics manufacturing, optical device manufacturing, etc., to realize complex glue dispensing tasks and precise glue mixing and jetting processes.
