Abstracts

According to our (Global Info Research) latest study, the global Two-component Static Dispense Valve market size was valued at US\$ 54.02 million in 2025 and is forecast to a readjusted size of US\$ 84.85 million by 2032 with a CAGR of 6.6% during review period.

In 2025, global sales of Two-component Static Dispense Valves are estimated at approximately 42,000 sets, with a mainstream ex-factory average price of around USD 1,250 per set. The gross margin of major manufacturers in the industry is approximately 30%-45%.

A Two-component Static Dispense Valve is a type of dispensing valve used for metering, mixing, and applying AB two-component adhesives. It typically consists of dual inlet channels for components A and B, a valve opening and closing mechanism, a snuff-back or shut-off structure, a dispensing outlet, and an interface for a static mixing nozzle. Its core feature is that the two adhesive components remain separated before entering the valve body, are synchronously controlled by the valve, and then enter the static mixing nozzle, where they are mixed through fixed helical elements or split-flow structures inside the nozzle. No motor-driven active stirring is required. This product is mainly suitable for two-component materials such as epoxy adhesives, polyurethane adhesives, silicone, thermally conductive potting compounds, structural adhesives, and sealants, and can be used for dispensing, potting, coating, bead dispensing, filling, and sealing processes.

The upstream supply chain of Two-component Static Dispense Valves mainly includes stainless steel, aluminum alloy, engineering plastics, seals, pneumatic components,

precision valve cores, static mixing nozzles, and connectors. Among them, valve body machining accuracy, corrosion resistance of sealing materials, snuff-back and shut-off stability, and compatibility with static mixing nozzles directly affect dispensing consistency and shut-off performance. Downstream applications mainly include consumer electronics, industrial electronics, automotive components, semiconductor packaging, and new energy batteries. The product is especially suitable for scenarios requiring precise two-component mixing ratio control, high dispensing accuracy, clean shut-off performance, and high automation integration. With the upgrading of electronic packaging, thermally conductive potting for new energy batteries, automotive electronics sealing, and automated dispensing processes, Two-component Static Dispense Valves are becoming increasingly important in precision fluid control equipment.
