According to our (Global Info Research) latest study, the global Two-photon Fluorescence Microscopy market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Two-photon Fluorescence Microscopy, means that it is possible to image living tissue to a depth of about 1 mm. It differs from conventional fluorescence microscopy in that the excitation wavelength is shorter than the emission wavelength because the wavelengths of the two excitation photons are longer than the wavelengths of the resulting emission light. Two-photon excitation microscopy usually uses near-infrared excitation light, which can also excite fluorescent dyes. However, for each excitation, the infra-red light of both photons is absorbed.
