Abstracts

The global Two-photon Fluorescence Microscopy market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Two-photon Fluorescence Microscopy, means that it is possible to image living tissue to a depth of about 1 mm. It differs from conventional fluorescence microscopy in that the excitation wavelength is shorter than the emission wavelength because the wavelengths of the two excitation photons are longer than the wavelengths of the resulting emission light. Two-photon excitation microscopy usually uses near-infrared excitation light, which can also excite fluorescent dyes. However, for each excitation, the infra-red light of both photons is absorbed.

This report studies the global Two-photon Fluorescence Microscopy production, demand, key manufacturers, and key regions.
