Abstracts

The global Two-way Airplane Solenoid Valve market size is expected to reach \$ 65 million by 2029, rising at a market growth of 0.7% CAGR during the forecast period (2023-2029).

A two-way airplane solenoid valve is an electrically operated valve that controls the flow of air or other fluids in an airplane's pneumatic system. It is typically used to control the pressure and flow of air to different parts of the aircraft, such as the brakes, landing gear, and other pneumatic components.

The two-way solenoid valve is designed to have two ports, an inlet port and an outlet port, that allow air or fluid to flow through the valve in either direction. When the valve is energized, the solenoid coil creates a magnetic field that pulls a plunger or armature inside the valve, allowing air or fluid to flow through the valve in one direction. When the valve is de-energized, a spring returns the plunger or armature to its original position, blocking the flow of air or fluid through the valve.

This report studies the global Two-way Airplane Solenoid Valve production, demand, key manufacturers, and key regions.
