Abstracts

According to our (Global Info Research) latest study, the global TWS Headphone Sensor market size was valued at US\$ 482 million in 2025 and is forecast to a readjusted size of US\$ 1089 million by 2032 with a CAGR of 12.5% during review period.

A sensor is a detection device that can sense the information that needs to be measured, and can convert the sensed information into electrical signals or other required forms of information output according to certain rules to meet the requirements of information transmission, processing, storage, display, recording, and control. TWS earphones also use various types of sensors to better assess and respond to user intent during use. For example, the TWS earphone cover opening and connecting function mentioned earlier requires the use of a Hall sensor; Wearing headphones can play music, requiring the use of optical or capacitive sensors; For touch control or tapping control of headphones, capacitive sensors or acceleration sensors are required.

In the development process of TWS earphones, the interaction mode has gone through multiple stages, from button pressing, tapping, touch, pressure sensing, to the integration of pressure and touch. There are currently three main technological paths in the market: capacitive touch, accelerometer (G-Sensor), and pressure sensing. With the use of pressure sensing sensors in Apple's AirPods Pro, it is possible to achieve a physical button like control without compromising the overall appearance of the earphones, and has high sensitivity and accuracy, avoiding ear canal pressure problems caused by accidental touch and tapping. The penetration rate of pressure sensing will gradually increase in the future.
