Abstracts

The global Type C Silica Gel market size is expected to reach \$ 365 million by 2032, rising at a market growth of 3.5% CAGR during the forecast period (2026-2032).

Type C Silica Gel is a classification of silica gel, belonging to coarse-pored silica gel, with a milky white transparent or translucent appearance, and is available in block or spherical shapes. It has a large pore size, a high specific surface area and strong adsorption capacity, and is widely used in desiccants, catalysts, industrial adsorption and other fields. The market demand for C-type silica gel is mainly supported by its unique physical and chemical properties, especially in terms of drying and moisture-proofing. According to application requirements, C-type silica gel can be modified to improve its thermal stability, chemical inertness and mechanical strength.

Type C silica gel, also known as large-pore silica gel, is typically manufactured using sodium silicate and sulfuric acid as primary raw materials. It is produced through a series of processes—including gel formation, aging, acid washing, water washing, drying, and screening—to yield porous silica gel in spherical or granular forms. The upstream sector primarily comprises suppliers of sodium silicate, sulfuric acid, process water, packaging materials, screening equipment, drying equipment, and environmental treatment systems; notably, factors such as the purity of the silica source, control over pore structure, and the stability of drying and screening operations directly influence the product's adsorption performance, mechanical strength, and dust levels. The midstream sector consists of Type C silica gel manufacturers, who produce various product types tailored to specific requirements regarding particle size, morphology, pore diameter, pore volume, and intended application. The downstream sector primarily utilizes these products in fields such as packaging and industrial desiccants, adsorbents, catalyst carriers, and silica gel cat litter.

In 2025, global sales volume is projected to be around 240,000 tons, with product prices largely ranging from \$1,000 to \$1,800 per ton and industry gross margins falling between 15% and 25%.

Type C silica gel, also known as macroporous silica gel, is a mature inorganic adsorbent material. The growth in demand for this material stems primarily from two categories of applications: first, stable industrial applications—such as gas dehydration and purification, acid removal from insulating oils, adsorption of fermentation products, and use as catalysts and catalyst carriers; and second, consumer-facing applications—specifically silica gel cat litter (or 'crystal' cat litter) and moisture-proofing agents for packaging. The downstream application landscape is relatively fragmented, yet the demand within these specific use cases is highly inelastic. Furthermore, China possesses comprehensive domestic capabilities for the production and processing of the necessary raw materials—sodium silicate and sulfuric acid—as well as the silica gel itself. Key constraints facing the industry include a high degree of product homogeneity, limited price elasticity, increasingly stringent environmental and energy consumption regulations, and a relatively low penetration rate of high-end applications. Consequently, future industry growth is unlikely to be driven by a sudden surge in any single application; rather, it will be propelled by the combined momentum of upgrading trends in pet-related consumption, rising demand for industrial gas purification, advancements in adsorption and separation processes within the fine chemical sector, and the expanding export activities of domestic silica gel manufacturers.
