## Abstracts

According to our (Global Info Research) latest study, the global Type I Interferon Receptor market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

The type I interferon (IFN) receptor (IFNAR) consists of two subunits, IFNAR1 and IFNAR2. However, the number of cognate ligands is unique among cytokine receptors, including 13 IFN $\alpha$  subtypes,  $\beta$ ,  $\gamma$ ,  $\delta$ ,  $\epsilon$ , and additional ligands in some species. The type I IFN receptor is distinct from the receptors required for type II IFN $\gamma$  (IFNGR1 and IFNGR2) and type III IFNs (IFNLR and IL10R $\alpha$ ). However, the component genes encoding each IFN receptor, IFNAR1, IFNAR2, IFNGR2, and IL10R $\alpha$ , are located in the cytokine receptor gene cluster on human chromosome 21q22.1 and are typical of functionally related genes. The type I interferon receptor (IFNAR) has an important role in mediating type I IFN responses in hematopoiesis, innate and acquired immunity to infection and cancer.
